

Hometown Brew POS System

Complete Features and Operations Overview | September 2026

1. System Overview

A custom, multi-tenant point-of-sale and business operations platform designed for cafes, kiosks, pop-up coffee services, and event bookings. The system combines customer ordering, staff operations, inventory, payments, loyalty, reporting, and real-time notifications in one application.

- Responsive customer-facing menu and account experience
- Admin, cashier, kitchen, rider, and staff workflows
- Real-time order and notification synchronization
- Tenant-specific data isolation, branding, settings, and operations

2. Customer Experience

- Browse products by category with descriptions, prices, availability, options, add-ons, combos, and dietary or allergen badges.
- Add products to a cart, select customizations, review totals, and submit orders.
- Support for pickup, dine-in, take-out, and delivery workflows where enabled.
- Delivery location selection with map support, address guidance, and distance-based delivery fees.
- Customer accounts with secure login, profile information, order history, booking history, and password management.
- Google and Facebook login integrations where configured.
- Real-time order status and order-ready notifications with optional sound and voice announcements.
- Dynamic store branding, colors, logos, banners, seasonal effects, and store operating notices.

3. Shopping, Payments, and Orders

- Product catalog with categories, images, pricing, stock availability, tags, sizes, flavors, add-ons, and combo choices.
- Cash, GCash, Maya, card, and loyalty-points payment workflows where configured.
- Payment tracking, payment references, discounts, taxes, delivery fees, and order totals.
- Order lifecycle management: pending, confirmed, preparing, ready, completed, and cancelled.
- Customer and staff order history with order numbers, dates, totals, statuses, and item details.
- Receipt and confirmation workflows for completed purchases.

4. Loyalty and Customer Rewards

- Registered customers earn loyalty points from eligible purchases.
- Points can be redeemed for eligible products using configured points costs.
- Point balances are stored on customer accounts and are independent of order-history cleanup.
- Point adjustments and reversals are handled when orders are cancelled or redemption transactions change.

5. Cashier and Store Operations

- Cashier workspace for processing orders, confirming payments, completing sales, and managing point redemptions.
- Cash drawer and shift workflows for opening, closing, cash counts, and shift records.
- Payment tracking for cash and configured digital payment methods.
- Operational controls for store closure, delivery availability, and customer-facing notices.

6. Kitchen and Fulfillment

- Kitchen display workflow for incoming orders, preparation progress, and completion.
- Real-time order updates across customer, cashier, kitchen, and management screens.
- Order-ready notifications and optional custom chimes or voice announcements.
- Preparation timing and estimated completion support.

7. Inventory and Supply Management

- Track finished products, raw ingredients, stock quantities, availability, and low-stock conditions.
- Raw-ingredient tracking can connect product and add-on consumption to ingredient stock.
- Automatic stock depletion for eligible sales and inventory adjustments.
- Inventory logs record restocks, sales deductions, adjustments, waste, and related references.
- Supplier records for supplier names, contacts, addresses, and supply costs.
- Product availability can be controlled so unavailable products or add-ons cannot be selected.

8. Event and Pop-Up Cafe Packages

- Admin-created packages with package name, description, price, features, icon, active status, and optional image.
- Current package tiers include The Curated, The Signature Pour, The Elevated Pour, and The Grand Pour.
- Each package defines its pax capacity, service duration, coffee selections, and non-coffee selections.
- Customers select the allowed drink types directly in the booking form.
- Custom drink requests link customers to the business Facebook page for inquiry.
- Booking form captures event type, venue, date, time, contact number, location guide, notes, and payment choice.
- Contact numbers are required and validated as exactly 11 digits.
- Downpayment is a fixed P1,000 deposit; full payment uses the package amount.
- Terms and Conditions are available from the package modal.
- Bookings move to Archives after the event date when fully paid; rejected and cancelled bookings are also archived.

9. Admin Dashboard

- Overview dashboard with revenue, expenses, profit, order counts, visitors, sales charts, and top categories.
- Order management for reviewing, filtering, updating, and monitoring customer orders.

- Reports for sales, accepted bookings, payments, inventory activity, and operational performance.
- Products and Categories management with product details, pricing, images, availability, tags, and options.
- Packages management with create, edit, activate, archive, and delete behavior that protects booking history.
- Inventory, inventory history, suppliers, expenses, staff, shifts, feedback, promotions, bookings, and devices modules.
- Booking review actions include payment requests, payment verification, acceptance, rejection, completion, and archive management.

10. Event Booking Administration

- Admin sees package name, customer, event date, venue, event type, payment method, package pax, and service duration.
- Selected coffee and non-coffee drinks are highlighted for staff in the booking details.
- Payment actions support fixed P1,000 downpayments and full-payment completion.
- Booking cards use responsive layouts for desktop, tablet, and mobile screens.

11. Notifications and Real-Time Updates

- WebSocket-based synchronization keeps relevant screens updated without manual refresh.
- Customers receive order-ready and booking payment notifications where configured.
- Admins receive notifications for new orders, booking requests, payment references, and operational events.
- Private tenant and user rooms help keep notifications isolated to the correct store and user.

12. Security and Data Isolation

- JWT authentication with protected cookies and role-based access control.
- Password hashing using bcrypt.
- Admin, manager, cashier, kitchen, rider, staff, and customer permissions are separated by workflow.
- Multi-tenant database filtering keeps stores and their data isolated.
- Private real-time channels prevent cross-store notification leakage.
- Rate limiting, security headers, CORS controls, and protected API routes.

13. Database, Files, and Storage

- PostgreSQL database accessed through Prisma ORM for structured, type-safe data operations.
- Uploaded files use Supabase Storage; the database stores file metadata and references.
- Customer points are stored on customer accounts, not derived from order rows.
- Audit logging has been disabled and existing AuditLog records have been cleared.

14. Backup and Data Retention

- Recommended monthly export includes orders, order items, payments, inventory logs, event bookings, and customer accounts.
- Exports should be stored by month with an additional backup copy in a separate

location.

- Exports should be opened and verified before old rows are deleted.
- Deleting orders may affect sales history, reports, refunds, and related records.
- Database maintenance may be required before PostgreSQL reclaims space after large deletions.

15. Current Storage Snapshot

- Current live database usage: approximately 13.3 MiB.
- Current regular orders: 8 rows.
- At 40 orders per day: approximately 14,600 orders per year.
- Estimated growth: approximately 30â 100 MB per year, depending on related records and order complexity.

The system is currently using a small amount of storage. The exact time until a storage limit is reached depends on the hosting plan quota, uploaded file storage, order volume, and retention policy.

Prepared for Hometown Brew | This overview describes the implemented system features and current operating configuration.
