

Database Storage Overview

Hometown Brew POS System | Prepared September 2026

Executive Summary

The live application database is currently using approximately 13 MB of storage. This is a small amount for a production POS database and there is no immediate storage concern. At an estimated 40 customer orders per day, the system would process approximately 14,600 orders per year. Based on the current data sample, expected database growth is approximately 30-100 MB per year, depending on order details, payments, notifications, and inventory records.

Current Usage

• Total database size: approximately 13.3 MiB (13,929,619 bytes)

• Current Order rows: 8

• Current OrderItem rows: 8

• Current AuditLog rows: 0; audit logging is disabled

Largest Tables

• AuditLog: 360 KB allocated table space; no active records are being stored

• objects: 304 KB; Supabase Storage file metadata and indexes

• Order: 264 KB; main customer order records

• users: 128 KB; customer, staff, and account records, including loyalty points

• OrderItem: 128 KB; products and quantities belonging to each order

• EventBooking: 80 KB; event package booking records

What Grows Over Time

Regular sales primarily add records to Order, OrderItem, Payment, InventoryLog, and Notification. Event package reservations add records to EventBooking. Customer loyalty points are stored on the customer account in users and are not recalculated from old orders.

The objects table stores metadata for uploaded files such as logos, product images, package images, and QR codes. The actual file contents are stored separately in Supabase Storage.

Forecast at 40 Orders Per Day

• 40 orders per day = approximately 1,200 orders per month

• 40 orders per day = approximately 14,600 orders per year

• Current order data averages about 1.9 KB per order in the present sample

• Raw Order and OrderItem data would add approximately 28 MB per year

• Allow approximately 30-100 MB per year after related records and indexes

The exact date when storage becomes full depends on the database quota and future usage patterns. Storage is not expected to fill quickly at the current projected volume.

Recommended Monthly Backup Plan

1. Export orders, order items, payments, inventory logs, event bookings, and customer accounts.
2. Store exports by month on the client hard drive.
3. Keep at least one additional backup copy in a separate location.

4. Open and verify each export before deleting any database records.
5. Delete old records only after confirming the backup is complete and usable.

Important Data-Safety Notes

- ⚠ Deleting orders can affect order history, reporting, refunds, and related records.
- ⚠ Deleting Order rows may also remove related OrderItem and Payment records.
- ⚠ Deleting old orders does not remove customer loyalty points stored in users.
- ⚠ PostgreSQL may need maintenance after deletion before disk space is reclaimed.
- ⚠ A backup should always be completed before bulk deletion.

Prepared for Hometown Brew | Storage information is based on the current live database snapshot.
